## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 1\_CY

Attempt : 1  
Total Mark : 40  
Marks Obtained : 40

#### Section 1 : Coding

##### 1. Problem Statement:

"Write a program that helps identify the type of a triangle based on the lengths of its three sides. The program prompts the user to input the lengths of sides 'a', 'b', and 'c', and then it classifies the triangle as 'Equilateral' if all sides are equal, 'Isosceles' if two sides are equal, or 'Scalene' if all sides are different. Can you provide the Java code for this task?"

##### ***Input Format***

The first line of the input is an integer 'a' representing the length of side 'a.'

The second line of the input is an integer 'b' representing the length of side 'b.'

The third line of the input is an integer 'c' representing the length of side 'c.'

### ***Output Format***

The program outputs a single line that specifies the type of the triangle:  
"Equilateral," "Isosceles," or "Scalene."

### ***Sample Test Case***

Input: 3

4

5

Output: The triangle is Scalene

### ***Answer***

// You are using Java

```
import java.util.Scanner;
```

```
class TriangleType {  
    public static void main(String[] args) {  
        Scanner scanner = new Scanner(System.in);  
  
        // Read the three side lengths  
        int a = scanner.nextInt();  
        int b = scanner.nextInt();  
        int c = scanner.nextInt();  
  
        // Check for triangle type  
        if (a == b && b == c) {  
            System.out.println("The triangle is Equilateral");  
        } else if (a == b || b == c || a == c) {  
            System.out.println("The triangle is Isosceles");  
        } else {  
            System.out.println("The triangle is Scalene");  
        }  
  
        scanner.close();  
    }  
}
```

**Status :** Correct

**Marks :** 10/10

2. Problem Statement:

Gilbert is tasked with writing a program that checks whether a given integer is an odd number. An odd number is one that cannot be exactly divided by 2. The program should take an integer as input and determine if it is an odd number or not. The task is to implement the logic to check if the provided integer is odd and return the result.

### ***Input Format***

The first line of the input contains an integer, "input".

### ***Output Format***

The output should display a boolean value, "result," which should be set to true if the input integer is an odd number and false if it is even.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 0

Output: Is the integer odd? false

### ***Answer***

```
// You are using Java
import java.util.Scanner;
class main{
    public static void main(String[] args){
        Scanner sc=new Scanner(System.in);
        int input=sc.nextInt();
        boolean result = (input % 2 !=0);
        System.out.println("Is the integer odd?" +result);
    }
}
```

**Status :** Correct

**Marks :** 10/10

### **3. PROBLEM STATEMENT:**

Jule a mathematician expert is given two integers to find if the second

integer is above the average of the first and second integer. Write a program that achieves this using the ternary operator.

### ***Input Format***

The first line of input represents the first integer.

The second line of input represents the second integer.

### ***Output Format***

The output should be displayed as "Below Average" or "Above Average"

REFER THE SAMPLE TESTCASES FOR THE FORMAT SPECIFICATIONS.

### ***Sample Test Case***

Input: 1

1

Output: Below Average

### ***Answer***

```
// You are using Java
import java.util.Scanner;
class main{
    public static void main(String[]args){
        Scanner sc =new Scanner(System.in);
        int num1=sc.nextInt();
        int num2=sc.nextInt();
        double average=(num1+num2)/2.0;
        String result=(num2>average)?"Above Average":"Below Average";
        System.out.println(result);
    }
}
```

**Status :** Correct

**Marks :** 10/10

## **4. Problem Statement**

Mandy is working on a cybersecurity project that involves basic encryption techniques. She wants to write a program that takes an integer number and performs a bitwise XOR operation to flip all the bits.

Help Mandy in this encryption using bitwise operations.

### ***Input Format***

The input consists of an integer N, representing the number to be flipped.

### ***Output Format***

The output displays "Result: " followed by an integer representing the result of the bitwise XOR operation to flip all the bits.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 0

Output: Result: 255

### ***Answer***

```
// You are using Java
import java.util.Scanner;
class main{
    public static void main(String[]args){
        Scanner sc=new Scanner(System.in);
        int n=sc.nextInt();
        int result=n^255;
        System.out.println("Result:"+result);
    }
}
```

**Status :** Correct

**Marks :** 10/10
